Partner team name: Intellectuals (plancs@rpi.edu)

- Develop a website hosting discussion forum by using threads.
- Design patterns: composite, interpreter, factory

Record meeting minutes for your design review—more specifically, only record minutes for the critique of your design.

Minutes:

- Debrief the high-level object-orientated description of the project.
- Review each other's UML class/relationship diagram and deployment diagrams.
- Design pattern discussions, feedback.
- Discuss some possible functionalities and new features of projects

Provide a list of your findings, including at least three major suggestions for refactoring portions of your design diagrams to more effectively show potential revisions and refactorings.

1. In general, try to avoid the singleton design pattern when developing a project. Link: **https://tinyurl.com/y2jf76ng**
2. Consider an unanswered question: notification when others reply to their comments. E.g. Comment and rating as the attribute to the user.
3. Link the farmers market class with users so that it could be more than an isolated extension. E.g. have a list of "nearby markets" associated with each user.
4. Make the farmer market extension more useful and convenient to access for the users. E.g. users could be able to add their frequently visited markets to "favorite markets".
5. Use MongoDB cloud server as our database server instead of only available on the localhost; this enables more efficient data storage.
